

Earth Prize - prototype explanation

**By: Eishaan &
Connor**

3d models

2025

Model A (with servo, no Arduino)

Dispenser system
dispenses even
amount of material
each time

Open space for
materialc with latch
on top to refill

Open space for
material with latch on
side to refill

Waterproof section
for arduino

Model B (with servo and Arduino)

3d models

2025

Dispenser system A

Dispenser system B

Expandable coiled wire for size adjustment. Wires connect soil sensor and servos from both dispensers to arduino

Soil sensor

Expandable to fit most compost bin sizes with clips to attach to edge of bins. Soil sensor expandable to reach optimal depth for most compost bin sizes.

Example on compost bin (compost bin not part of design and front open only for ease of view)

Arduino Schematics

2025

The sensor measures temperature and moisture to regulate the ideal compost ratio. The servos rotate the dispenser mechanism and drop a controlled amount each time

2025
